# Computational Tools and Techniques for Numerical Macro-Financial Modeling 

Victor V. Zhorin

MFM/BFI

March 7, 2017

## Numerical Building Blocks

## Spectral approximation technology (chebfun):

numerical computation in Chebyshev functions
piece-wise smooth functions
breakpoints detection
rootfinding
functions with singularities
fast adaptive quadratures
continuous QR, SVD, least-squares
linear operators
solution of linear and non-linear ODE
Fréchet derivatives via automatic differentiation
PDEs in one space variable plus time

## Stochastic processes:

(quazi) Monte-Carlo simulations, Polynomial Expansion (gPC), finite-differences (FD) non-linear IRF
Borovička-Hansen-Sc[heinkman shock-exposure and shock-price elasticities
Malliavin derivatives

## Many states:

Dimensionality Curse Cure
low-rank tensor decomposition
sparse Smolyak grids

Numerical Building Blocks (cont.)

## Horse race: methods and models

## models

He-Krishnamurthy, "Intermediary Asset Pricing"<br>Klimenko-Pfeil-Rochet-DeNicolo, "Aggregate Bank Capital and Credit Dynamics"<br>Brunnermeier-Sannikov, "A Macroeconomic Model with a Financial Sector"<br>Basak-Cuoco, "An Equilibrium Model with Restricted Stock Market Participation"<br>Di Tella, "Uncertainty Shocks and Balance Sheet Recessions"

## methods

spectral technology vs discrete grids
Monte-Carlo simulations (MC) vs Polynomial Expansion (gPC) vs finite-differences SPDE (FD)
Smolyak sparse grids vs tensor decomposition

## criteria

elegance: clean primitives, libraries, ease of mathematical concepts expression in code
speed: feasibility, ready prototypes, LEGO blocks; precision: numerical tests of speed vs stability trade-offs common metrics: shock exposure elasticity, asset pricing implications

Given Chebyshev interpolation nodes $z_{k}, k=1, \ldots, m$ on $[-1,1]$

$$
z_{k}=-\cos \left(\frac{2 k-1}{2 m} \pi\right)
$$

and Chebychev coefficients $a_{i}, i=0, \ldots, n$ computed on Chebychev nodes we can approximate

$$
\mathbb{F}(x) \approx \sum_{i=0}^{n} a_{i} T_{i}(x) ; a_{i}=\frac{2}{\pi} \int_{-1}^{1} \frac{\mathbb{F}(x) T_{i}(x)}{\sqrt{1-x^{2}}} d x
$$

"Approximation Theory and Approximation Practice", by Lloyd N. Trefethen (chebfun.org)
"Chebyshev and Fourier Spectral Methods", by John P. Boyd
Chebyshev interpolation nodes and degree of polynomials have to be adaptive during continuous Newton updates.
(i) When in doubt, use Chebyshev polynomials unless the solution is spatially periodic, in which case an ordinary Fourier series is better.
(ii) Unless youre sure another set of basis functions is better, use Chebyshev polynomials.
(iii) Unless youre really, really sure that another set of basis functions is better, use Chebyshev polynomials

## shock-exposure and shock-price elasticity first kind

Multiplicative functional $M_{t}$ :

1) consumption $C_{t}$ for consumption shock-exposure
2) stochastic discount factor $S_{t}$ for consumption shock-price elasticity

$$
\begin{gathered}
d \log M_{t}=\beta\left(X_{t}\right) d t+\alpha\left(X_{t}\right) d B_{t} \\
\epsilon(x, t)=\sigma(x) \frac{\partial}{\partial x} \log \mathbb{E}\left[M_{t} \mid X_{0}=x\right]+\alpha(x)
\end{gathered}
$$

Define

$$
\phi(x, t)=\mathbb{E}\left[\left.\frac{M_{t}}{M_{0}} \right\rvert\, X_{0}=x\right]
$$

Then solve PDE

$$
\frac{\partial \phi(x, t)}{\partial t}=\frac{1}{2} \sigma^{2}(x) \frac{\partial^{2}}{\partial x^{2}} \phi(x, t)+(\mu(x)+\sigma(x) \alpha(x)) \frac{\partial}{\partial x} \phi(x, t)+\left(\beta(x)+\frac{1}{2}\left|\alpha(x)^{2}\right|\right) \phi(x, t)
$$

s.t. initial boundary condition $\phi(x, 0)=1$

## shock-exposure and shock-price elasticity second kind

Multiplicative functional $M_{t}$ :

1) consumption $C_{t}$ for consumption shock-exposure
2) stochastic discount factor $S_{t}$ for consumption shock-price elasticity

$$
d \log M_{t}=\beta\left(X_{t}\right) d t+\alpha\left(X_{t}\right) d B_{t}
$$

The elasticity of second kind is

$$
\epsilon_{2}\left(X_{t}\right)=\frac{\mathbb{E}\left(\mathfrak{D}_{t} M_{t}\right) \mid \mathcal{F}_{0}}{\mathbb{E} M_{t} \mid \mathcal{F}_{0}}
$$

Use specification for $M_{t}$ to get

$$
\epsilon_{2}\left(X_{t}\right)=\frac{\mathbb{E}\left(M_{t} \eta\left(X_{t}\right) \alpha\left(X_{t}\right)\right) \mid \mathcal{F}_{0}}{\mathbb{E} M_{t} \mid \mathcal{F}_{0}}
$$

Then solve PDE twice

$$
\frac{\partial \phi(x, t)}{\partial t}=\frac{1}{2} \sigma^{2}(x) \frac{\partial^{2}}{\partial x^{2}} \phi(x, t)+(\mu(x)+\sigma(x) \alpha(x)) \frac{\partial}{\partial x} \phi(x, t)+\left(\beta(x)+\frac{1}{2}\left|\alpha(x)^{2}\right|\right) \phi(x, t)
$$

s.t. initial boundary condition $\phi(x, 0)=1$ to get a solution $\phi_{1}(x, t)$ and initial boundary condition $\phi(x, 0)=\alpha(x)$ to get a solution $\phi_{2}(x, t)$ Then, second type elasticity is

$$
\epsilon_{2}(x, t)=\frac{\phi_{2}(x, t)}{\phi_{1}(x, t)}
$$

"Intermediary Asset Pricing" : Zhiguo He and Arvind Krishnamurthy, AER, 2013
Find $\frac{P_{t}}{D_{t}}=F(y), \forall y \in\left[0, \frac{1+1}{\rho}\right]$, by solving

$$
\begin{aligned}
& F^{\prime \prime}(y) \theta_{s}(y) G(y)^{2} \frac{\left(\theta_{b}(y) \sigma\right)^{2}}{2} \frac{G(y)}{\theta_{s}(y) F(y)}\left(\frac{1+I+\rho y(\gamma-1)}{1+I-\rho y+\rho \gamma G(y) \theta_{b}(y)}\right) \\
= & \rho+g(\gamma-1)-\frac{1}{F(y)}+\frac{\gamma(1-\gamma) \sigma^{2}}{2}\left(1+\frac{\rho G(y) \theta_{b}(y)}{1+I-\rho y}\right) \frac{y-G(y) \theta_{b}(y)}{\theta_{s}(y) F(y)}\left[\frac{1+I-\rho y-\rho G(y) \theta_{b}(y)}{1+I-\rho y+\rho \gamma G(y) \theta_{b}(y)}\right] \\
& -\left(\frac{(1+I-\rho y)(G(y)-1)}{\theta_{s}(y) F(y)}+\gamma \rho G(y)\right) \frac{\theta_{s}(y)+I+\theta_{b}(y)(g(\gamma-1)+\rho)-\rho y}{1+I-\rho y+\rho \gamma G(y) \theta_{b}(y)} .
\end{aligned}
$$

where

$$
G(y)=\frac{1}{1-\theta_{s}(y) F^{\prime}(y)},
$$

and

|  | if $y \in\left(0, y^{c}\right)$ | if $y \in\left(y^{c}, \frac{1+l}{\rho}\right)$ |
| :---: | :---: | :---: |
| $\theta_{s}(y)=$ | $\frac{(1-\lambda) y}{F(y)-\lambda y}$ | $\frac{m}{1+m}$ |
| $\theta_{b}(y)=$ | $\lambda y \frac{F(y)-y}{F(y)-\lambda y}$ | $y-\frac{m}{1+m} F(y)$ |

The endogenous threshold $y^{c}$ is determined by $y^{c}=\frac{m}{1-\lambda+m} F\left(y^{c}\right)$. Boundary conditions on $y=0$ and $y=\frac{1+l}{r}$.

$$
F(0)=\frac{1+F^{\prime}(0) I}{\rho+g(\gamma-1)+\frac{\gamma(1-\gamma) \sigma^{2}}{2}-\frac{l \gamma \rho}{1+I}} ; F\left(\frac{1+I}{\rho}\right)=\frac{1+I}{\rho} ; F^{\prime}\left(\frac{1+I}{\rho}\right)=1 .
$$

## He-Krishnamurthy, BVP solution

$$
\begin{gathered}
d X_{t}=\mu_{y}\left(X_{t}\right) d t+\sigma_{y}\left(X_{t}\right) d B_{t}, X_{t}=\frac{w_{t}}{P_{t}} ; \sigma_{y}\left(X_{t}\right)=-\frac{\theta_{b}}{1-\theta_{s} F^{\prime}(y)} \sigma ; X_{t}=\frac{F(y)-y}{F(y)} \\
d \log C_{t}=\beta\left(X_{t}\right) d t+\alpha\left(X_{t}\right) d B_{t} ; d \log S_{t}=-\gamma \log C_{t} \\
\beta(x)=\mu(x) \xi(x)+\frac{1}{2} \sigma(x)^{2} \frac{\partial \xi}{\partial x}+g_{d}-\frac{\sigma_{d}^{2}}{2} ; \alpha(x)=\sigma(x) \xi(x)+\sigma_{d} ; \xi(x)=-\rho \frac{p^{\prime}(x)(1-x)-p(x)}{1+1-\rho(1-x) p(x)}
\end{gathered}
$$

stationary density distribution, percentiles

## He-Krushnamurthy: shock exposure, specialist C

(a) type 1 elasticity

(b) type 2 elasticity

He-Krushnamurthy: price exposure, specialist C

(a) type 1 elasticity

(b) type 2 elasticity

## Brunnermeier-Sannikov example

$$
\frac{d X_{t}}{X_{t}}=\mu\left(X_{t}\right) d t+\sigma\left(X_{t}\right) d B_{t}-d \zeta_{t}, X_{t}=\frac{N_{t}}{q_{t} K_{t}}
$$

$X(t)$ : expert share of wealth
Consumption is aggregate output net of aggregate investment

$$
\begin{gathered}
C_{t}^{a}=\left[a \psi\left(X_{t}\right)+\underline{a}\left(1-\psi\left(X_{t}\right)\right)\right] K_{t} \\
d \log C_{t}=\beta\left(X_{t}\right) d t+\alpha\left(X_{t}\right) d B_{t}
\end{gathered}
$$

where

$$
\alpha(X)=\sigma ; \beta(X)=\Phi(X)-\delta-\sigma^{2} / 2
$$

For log-utility

$$
S_{t} / S_{0}=\mathbf{e}^{-\rho t} C_{0} / C_{t}
$$

## Brunnermeier-Sannikov: shock exposure, aggregate C

for logarithmic utility consumption of both households and experts are myopic, proportional to their wealth $N_{t}$

$$
\begin{gathered}
d \zeta_{t}=\rho d t ; d \log C_{t}=d \log K_{t} \\
d \log K_{t}=\left(\Phi\left(i_{t}\right)-\delta \psi_{t}-\underline{\delta}\left(1-\psi_{t}\right)-\frac{1}{2} \sigma^{2}\right) d t+\sigma d B_{t}
\end{gathered}
$$

for $\delta=\underline{\delta}$

$$
\alpha(X)=\sigma ; \beta(X)=\Phi(X)-\delta-\frac{1}{2} \sigma^{2}
$$

(a) type 1 elasticity

(b) type 2 elasticity

## Brunnermeier-Sannikov: price exposure, aggregate C

for logarithmic utility consumption of both households and experts are myopic, proportional to their wealth $N_{t}$

$$
\begin{gathered}
d \zeta_{t}=\rho d t ; d \log C_{t}=d \log K_{t} \\
d \log K_{t}=\left(\Phi\left(i_{t}\right)-\delta \psi_{t}-\underline{\delta}\left(1-\psi_{t}\right)-\frac{1}{2} \sigma^{2}\right) d t+\sigma d B_{t}
\end{gathered}
$$

for $\delta=\underline{\delta}$

$$
\alpha(X)=\sigma ; \beta(X)=\Phi(X)-\delta-\frac{1}{2} \sigma^{2}
$$

(a) type 1 elasticity

(b) type 2 elasticity

## Model Settings, Klimenko, Pfeil, Rochet, DeNicolo (KPRD)

## State - equity $E$

Multiplicative functional $M=R(E)$

$$
d E_{t}=\mu\left(E_{t}\right) d t+\sigma\left(E_{t}\right) d B_{t}, p+r \leq R_{t} \leq R_{\max }
$$

where

$$
\begin{gathered}
\mu(E)=E r+L(R(E))(R(E)-r-p) ; \sigma(E)=L(R(E)) \sigma_{0} \\
\int_{0}^{E_{\max }} \frac{R(s)-p-r}{\sigma_{0}^{2} L(R(s))} d s=\ln (1+\gamma) ; u(E)=\exp \left(\int_{E}^{E_{\max }} \frac{R(s)-p-r}{\sigma_{0}^{2} L(R(s))} d s\right)
\end{gathered}
$$

with

$$
L(R)=\left(\frac{\bar{R}-R}{\bar{R}-p}\right)^{\beta}
$$

where $u(E)$ is market-to-book value

$$
d \log R=\frac{R(E)^{\prime}}{R(E)} d E=\psi(E) d E \rightarrow d \log R_{t}=\beta\left(E_{t}\right) d t+\alpha\left(E_{t}\right) d B_{t}
$$

where $\beta(E)=\mu(E) \psi(E)+\frac{1}{2} \sigma(E)^{2} \frac{\partial \psi(E)}{\partial E}, \alpha(E)=\sigma(E) \psi(E)$; s.t. Neumann b.c.: $\left.\frac{\partial \phi_{t}(E)}{\partial x}\right|_{E_{\min , \max }}=0$

$$
R^{\prime}(E)=-\frac{1}{\sigma_{0}^{2}} \frac{2(\rho-r) \sigma_{0}^{2}+[R(E)-p-r]^{2}+2 r E[R(E)-p-r] L(R(E))^{-1}}{L(R(E))-L^{\prime}(R(E))[R(E)-p-r]}, R\left(E_{\max }\right)=p+r
$$

## State Space (E) drift $\mu(E)$ and volatility $\sigma(E)$, functional $M: \alpha(E), \beta(E)$

Klimenko, Pfeil, Rochet, DeNicolo (KPRD), revised
(a) $\mu(E)$

(a) $\beta(E)$

(b) $\sigma(E)$

(b) $\alpha(E)$

stationary density in $E$ and $R$, Klimenko, Pfeil, Rochet, DeNicolo (KPRD)
in E space

in R space (identical to a graph in KPRD paper)

# $R=R(E)$, Klimenko, Pfeil, Rochet, DeNicolo (KPRD) 

$$
\mathrm{R}=\mathrm{R}(\mathrm{E})
$$

## Shock-exposure elasticity for $R=R(E)$ (KPRD)

(a) type 1 elasticity

(b) type 2 elasticity

## SDF and price elasticity, Klimenko, Pfeil, Rochet, DeNicolo (KPRD)

## State - equity $E$

Multiplicative functional for SDF $M=u(E)$

$$
u(E)=\exp \left(\int_{E}^{E_{\max }} \frac{R(s)-p-r}{\sigma_{0}^{2} L(R(s))} d s\right)
$$

with

$$
L(R)=\left(\frac{\bar{R}-R}{\bar{R}-p}\right)^{\beta}
$$

where $u(E)$ is market-to-book value

## Price elasticity for $R=R(E)$ (KPRD)

(a) type 1 elasticity

(b) type 2 elasticity

## Malliavin Derivative

```
and Generalized Polynomial Chaos Expansion (gPC)
```

Fast technique for high-precision numerical analysis of stochastic non-linear systems
Malliavin calculus to integrate and differentiate processes that are expressed in generalized Polynomial Chaos (gPC)

Generating function

$$
\exp \left(s x-\frac{s^{2}}{2}\right)=\sum_{n=0}^{\infty} \frac{s^{n}}{n!} H_{n}(x) ; H_{n}(x) \text { are orthogonal Hermite polynomials }
$$

Let $B_{t}$ be Brownian motion, $M_{t}=\exp \left(s B_{t}-\frac{s^{2} t}{2}\right)$
Then (Ito)

$$
\begin{gathered}
d M_{t}=s \sum_{n=0}^{\infty} \frac{s^{n}}{n!} x_{n}(t) d B_{t}, x_{n}(t)=t^{n / 2} H_{n}\left(B_{t} / \sqrt{t}\right) \\
d x_{n}(t)=n x_{n-1} d B_{t} ; x_{n}(t)=n!\int_{0}^{t} d B\left(t_{n-1}\right) \int_{0}^{t_{n}-1} d B\left(t_{n-2}\right) \ldots \int_{0}^{t 2} d B\left(t_{1}\right)
\end{gathered}
$$

$u\left(t, B_{t}\right) \approx \sum_{i=0}^{p} u_{i}(t) H_{i}\left(B_{t}\right)$, Cameron and Martin for Gaussian random variables, Xiu-Karniadakis for generalized

$$
u_{0}(x, t)=\mathbb{E}\left[u(x, t, \xi) H_{0}\right]=\mathbb{E}[u(x, t, \xi)]
$$

## from SDE to ODEs

Let $\hat{H}_{n} \xi:=H_{n}(\xi) / \sqrt{n!}$
Then the Malliavin derivative operator (annihilation operator) with respect to random variable $\xi$ is: $\mathbb{D}_{\xi}\left(H_{n}(\xi)\right):=\sqrt{n} H_{n-1}(\xi)$
Malliavin divergence operator (creation operator, Skorokhod integral) with respect to $\xi$ is: $\delta_{\xi}\left(H_{n}(\xi)\right):=\sqrt{n+1} H_{n+1}(\xi)$
extended to nonlinear functionals of random variables expressed with PC decomposition
Ornstein-Uhlenbeck operator $L:=\delta \circ \mathbb{D}$ (and its semigroup) - the Hermite polynomials are eigenvectors

## from SDE to ODEs (cont)

Loan rate $R_{t}=R\left(E_{t}\right)$ :

$$
\begin{gathered}
d R_{t}=\mu\left(R_{t}\right) d t+\sigma\left(R_{t}\right) d B_{t}, p \leq R_{t} \leq R_{\max } \\
R_{t}=r_{0}+\int_{0}^{t} \mu\left(R_{\tau}\right) d \tau+\int_{0}^{t} \sigma\left(R_{\tau}\right) d B_{\tau} \\
R_{t} \approx \sum_{i=0}^{p} r_{i}(t) H_{i}(\xi) ; B(t, \xi) \approx \sum_{i=1}^{n} b_{i}(t) H_{i}(\xi), \xi \sim N(0,1),\left\{H_{i}\right\}-\text { Hermite polynomials : KLE }
\end{gathered}
$$

Integration by parts: $\mathbb{E}\left[F \int_{0}^{t} R_{\tau} d B_{\tau}\right]=\mathbb{E}\left[\int_{0}^{t} \mathbb{D}_{\xi} F R_{\tau} d \tau\right]$

$$
\dot{r}_{i}(t) \approx\left\langle\mu\left(R_{t}\right)\right\rangle_{i}+\sum_{j=1}^{n} \sqrt{j} b_{j}(t)\left\langle\sigma\left(R_{t}\right)\right\rangle_{j-1}, i=0, \ldots, p
$$

Non-linear IRF: $F_{t}=\mathbb{D}_{0} R_{t}$ from Borovicka-Hansen-Scheinkman

## Stochastic Galerkin and Polynomial Chaos Expansion

for Stochastic PDE

Spectral expansion in stochastic variable(s): $\xi \in \Omega$ :

$$
u(x, t, \xi)=\sum_{i=0}^{\infty} u_{i}(x, t) \psi_{i}(\xi)
$$

where $\psi_{i}(\xi)$ are orthogonal polynomials (Hermite, Legendre, Chebyshev)
standard approximations (spectral or finite elements) in space and polynomial (also spectral or pseudo-spectral) approximation in the probability domain
Babuska, Ivo, Fabio Nobile, and Raul Tempone. "A stochastic collocation method for elliptic partial differential equations with random input data." SIAM Journal on Numerical Analysis 45.3 (2007): 1005-1034.

$$
u(x, t, \xi) \approx \sum_{i=0}^{p} u_{i}(x, t) \psi_{i}(\xi)
$$

substitute into PDE and do a Galerkin projection by multiplying with $\psi_{k}(\xi)$

$$
\frac{\partial u}{\partial t}=a(\xi) \frac{\partial^{2} u}{\partial x^{2}} ; \sum_{i=0}^{p} \frac{\partial u_{i}(x, t)}{\partial t}\left\langle\psi_{i} \psi_{k}\right\rangle+\sum_{i=0}^{p} \frac{\partial^{2} u_{i}}{\partial x^{2}} \sum_{j=0}^{p_{\sigma}} a_{j}\left\langle\psi_{j} \psi_{i} \psi_{k}\right\rangle, k=0, \ldots, p
$$

## Monte-Carlo/gPC comparison (sglib)

gPC expansion for $\ln N\left(\mu, \sigma^{2}\right)$ with $\mu=0.03, \sigma=0.85$, comparison with exact value and MC (1,000 and 100,000 samples)

| $\mathrm{p}=0$ | exact | gPC | MC( 1,000 ) | MC $(100,000)$ |
| :---: | :---: | :---: | :---: | :---: |
| mean: | 1.47883 | 1.47863 | 1.42357 | 1.48603 |
